

Secure Visitor Management Solution

SecureVisitor is a Management solution which replaces the traditional Visitor's Register Book. All information is electronically captured from the visitor's driving license card and vehicle license disk, recorded and time stamped. Records are stored on the device and automatically downloaded to the Cloud when a connection is available.

Scanners

SecureVisitor supports two types of scanners: The LR2 and LR4.

LR2	LR4
 <p>The LR2 scanner is the most popular scanner used by the security industry. It scans and verifies South African driving licenses as well as AAMVA driving licenses. The scanner captures and displays on screen the details of the driver including a photograph, for verification. The LR2 also scans vehicle license disks. It captures all the details displayed on the license disk including make, model, colour, VIN number, NATIS number, registration number, expiry date, etc. The LR2 is compact and tough, with a proven track record of reliability.</p>	 <p>The LR4 scanner is the latest device which is Android based. It has the same basic functionality as the LR2 but also includes a keyboard and GPS. This enables the LR2 to capture additional details of visitors. The LR4 also provides additional security as each user is required to log in before using the SecureVisitor App.</p>

Reporting

Full reporting is available through the SecureVisitor Cloud service. www.securevisitor.co.za

Site Requirements

Both scanners can store up to 30,000 transactions locally. An Internet connection is required to upload the scans to the Cloud service. A WiFi to 3G router can also be used. The data usage of the scanner can be up to 30MB per month. The battery of the scanner lasts up to 3 days depending on usage. A power point is required to charge the scanner. The warranty on scanners is 12 months.
